

3 REASONS

WHY PREVENTIVE DENTAL CARE MATTERS

1

Fluoride treatments and sealants are available for kids to help prevent cavities which can be costly to treat.

2

Your dentist can spot oral symptoms of more than 120 diseases including diabetes and heart disease.¹

Dental exams can help detect and treat these diseases early!

3

Adults who visit the dentist yearly are **37% more likely to report good or better oral health.**

Those who report good oral health are almost **twice as likely to report good or better overall well-being.**²

Don't forget, most dental plans cover preventive services at 100%. That means \$0 cost for exams and cleanings for you!
